The invention is useful for diagnosing or treating an anti-TNF related condition in a cell, tissue, organ or animal and in immunotherapy. The invention is also useful for treating TNF related diseases chosen from obesity, immune related disease such as rheumatoid arthritis, cardiovascular disease such as stroke, malignant disease such as leukaemia, neurological disease such as multiple sclerosis and bacterial or viral infections such as hepatitis. The present sequence is the human 9E7LC light chain protein (variable region and J-region). This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ful for

The present invention relates to a mammalian anti-tumour necrosis factor (TNF) antibody capable of inhibiting binding of TNF alpha to TNF receptor. The invention is useful for diagnosing or treating an anti-TNF related condition in a cell, tissue, organ or animal and in immunotherapy. The invention is also useful for treating TNF related diseases chosen from obesity, immune related disease such as rheumatoid arthritis, cardiovascular disease such as stroke, malignant disease such as leukaemia, neurological disease such as multiple sclerosis and bacterial or viral infections such as hepatitis. The present sequence is the human anti-TNF antibody light chain variable region protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 EIVLTQSPATLSLSPGERATLSCRASQSVSSYLAWYQQKPGQAPRLLIYDASNRATGIPA

The present sequence is that or a numan anti-interleuxin-1 receptor type (IL-1R1) monoclonal antibody (MAb) light chain. The invention provides antibodies that comprise this sequence. Human MAbs to IL-1R1 were prepared using the HCo7 strain of transgenic mice, which expresses human antibody genes. These mice were immunised with purified recombinant IL-1R1, and splenocytes from immunised mice were fused to a mouse myeloma cell line to generate hybridomas. Hybridomas which secreted a MAb that bound with high avidity to IL-1R1 were selected. The MAbs inhibit IL-1 signalling by competing with IL-1beta and IL-1alpha binding to IL-1R. These MAbs, as well as single chain antibodies and (Fab') antibodies are used in methods of treating IL-1 mediated diseases or for detecting the amount of IL-1R1 in a sample. IL-1 mediated diseases include acute pancreatitis, amyotrophic lateral sclerosis, Alzheimer's disease, cachexia, anorexia, asthma, atherosclerosis, autoimmune coronary conditions, cancer including leukaemia and tumour metastasis, diabetes, endometriosis, fever, fibromyalgia, glomerulonephritis, unflammatory versus host disease, osteoarthritis, rheumatoid arthritis, inflammatory eye disease, ischaemia, Rawasaki's disease, learning impairment, lung eye disease, lischaemia, Rawasaki's disease, learning impairment, lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         temporal

antibody which binds activated alpha-E integrin, specifically tion-induced epitope on integrin alpha-E chain (CD103), usefuing inflammatory bowel diseases e.g., Crohn's disease, activation-induced epitope ctreating inflammatory bowel gastroenteritis. Novel

9; 67pp; English Disclosure; SEQ ID NO

This invention relates to novel antibody and antigen-binding fragments of antibodies that bind alphaE-beta7 integrin chains (CD103). Specifically, it refers to the binding of activation induced epitopes present on activated alphaE integrins, where these integrins are activated by exposure to divalent cations (e.g. Mn2+), to phorbol esters or suitable growth factors and/ or mitogens. The present invention describes the alphaE-beta7 integrin as a homing receptor that mediates lymphocyte migration to mucosal epithelium. As such, compositions of this invention are useful for treating a subject having an inflammatory bowel disease such as asthma and chronic bronchitis. Furthermore, such compositions can be used for inhibiting graft rejection, psoriasis, compositions can be used for inhibiting graft rejection, psoriasis, commonsitions and be used for inhibiting graft rejection, psoriasis, corema, urticaria, scleroderma, autoimmune diseases such as multiple sclerosis, diabetes, glomerulonephritis, autoimmune thyroiditis, Behcet's syndrome, viral infections, cancer and/or neoplastic diseases such as leukaemias and lymphomass Accordingly, they exhibit antiinflammatory, antiasthmatic, immunosuppressive, antipsoriatic, dermatological, neuroprotective, antidiabetic, nephrotropic, virucide, cytostatic and vasotropic activities. This polypeptide sequence is a human antibody that binds the integrin alphaE chain of the invention.

The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody to OPGL, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in treating bone disorders, such as osteoporosis, bone loss from arthritis, baget's disease or osteopenia. The antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence the protein. The present sequence represents a sequence

The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody to OPGL, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in the reating bone disorders, such as osteoporosis, bone loss from arthritis, reating bone disorders, such as osteoporosis, bone loss from arthritis, beget's disease or osteopenia. The antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

Claim 12; SEQ ID NO 101; 232pp; English.

The present invention describes a method (M1) for identifying an antipoducing an antibody (I) in a mammal. The autoantibody is detected by producing an antibody phase display library from B-lymphocytes obtained from the mammal, and screening the library to detect a phase that capering comparises panning the phase on intact platelets using competitive cellscapering the phase on intact platelets using competitive cellscarface panning. Also described: (I) an autoantibody identified by (M1); (2) an isolated nucleic acid encoding an anti-platelet autoantibody; (3) inhibiting (M2) blood clotting in a mammal having a thrombus or at risk of thrombus formation; (4) reversibly (M3) inhibiting blood clotting in a mammal having a thrombus or at risk of thrombus formation; (5) inhibiting (M4) binding of an anti-platelet autoantibody with a platelet component; (6) inhibiting (M3) platelet adhesion in a mammal; (8) inhibiting (M6) platelet aggregation, (9) inhibiting (M8) platelet dinction; (11) inhibiting (M1) binding of an anti-platelet autoantibody, or its biologically active fragment with a platelet autoantibody with a platelet, (12) identifying (M1) a peptide that inhibits binding of an anti-platelet autoantibody, with a platelet, (13) appetide that inhibiting platelet autoantibody, (15) treating (M12) idiopathic thrombocytopenic purpura (ITP) in a mammal; and (16) a kit for reversibly inhibiting blatelet activation comprising an amount of an anti-platelet autoantibody, (15) treating (M12) idiopathic thrombocytopenic platelet autoantibody, (15) a kit for reversibly inhibiting blatelet activation comprising an amount of an anti-platelet autoantibody, or its biologically active fragment that anti-platelet autoantibody, the kit further comprising a peptide autoantibody, or its fragment comprises an antigen binding region derived from an H4414 anti-platelet autoantibody, the kit further comprising a peptide anti-platelet autoantibody, or the antoantibodies (1) has been ensethed and an instructions for use. (1) has haemostati ytopenic iting blood function t and diagnosing clotting in a (5) inhibiting or and an instructions for use. (I) has haemostatic, anticoagulant and thrombolytic activities. The autoantibodies (I) are useful for diagno and for developing therapeutics for diseases mediated by autoantibody

```
The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody to OPGL, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis, cations of the antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence
                                                                                                                                                                           ö
                                                                                                                                                                                                               9
                                                                                                                                                                                                                                               9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes an isolated human antibody (1) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (1); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (1) or a pharmaceutical amount of (1); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (1) under conditions that allow for binding of the antibody to OPGL, and measuring the level of bound antibody in the sample. (1) has osteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis, baget's disease or osteopenia. The antibody (1) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence the protein the exemplification of the present invention.

The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method for detecting OPGL in a biological sample, comprising contacting the sample with (I) under conditions that allow for binding of the antibody to OPGL, and measuring the level of bound antibody in the sample. (I) has osteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis, Paget's disease or osteopenia. The antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence the protein is used in the exemplification of the present invention.

                                                                                                                                              П
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes an isolated human antibody (I) that specifically binds osteoprotegerin ligand (OPGL). Also described: (1) a pharmaceutical composition comprising a pharmaceutical carrier and a therapeutic amount of (I); (2) methods of treating an osteopenic disorder in a patient, comprising administering to a patient the pharmaceutical composition of (I) or a pharmaceutical amount of (I); and (3) a method in a patient of (I); and (I) a method in a patient of (I); and (I) a method in a patient of (I); and (I) a method in a composition of the antibody in the sample. (I) has consteopathic, antiarthritic and cytostatic activities, and can be used in gene therapy. The composition and methods are useful in diagnosing or treating bone disorders, such as osteoporosis, bone loss from arthritis, agent's disease or osteopenia. The antibody (I) may also be used for detecting OPGL in biological samples and in identifying cells or tissues that produce the protein. The present sequence represents a sequence which is used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes antibodies or their functional fragments that bind to TRAIL-R1 and/or TRAIL-R2. TRAIL-R1 and TRAIL-R2 antibodies have cytostatic and apoptotic activities, and can be used in antibody therapy. The antibodies can be applied as remedies and preventives of diseases due to cells expressing TRAIL-R1 and TRAIL-R2, which are useful in the therapy of malignant tumours. Remedies produced with the antibodies are highly safe, and avoid hepatotoxicity. The present sequence represents an anti-TRAIL-R antibody amino acid sequence from the than the sequence represents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             civity of inducing apoptosis of connormal cells expressing TRA for use in therapy of malignant

The present invention describes a method (M1) for amplifying a nucleic acid strand (S) acid strand. M1 comprises providing an engineered nucleic acid strand (S) having a predetermined sequence at one end and a sequence complementary to the predetermined sequence at the other, and contacting (S) with a primer having the predetermined sequence in the presence of a polymers and nucleotides under conditions suitable for polymerisation of the nucleotides. Also described is an engineered nucleic acid strand (I) having a predetermined sequence at the other end. M1 is useful for to the predetermined sequence at the other end. M1 is useful for amplifying a nucleic acid. M1 can be used for producing an antibody library. M1 is useful for preparing amplified products that can be used to transform an appropriate host organism to produce the polypeptide or protein encoded by the target sequence. M1 is useful to amplify a family of related sequences to build a complex library such as, for example an antibody library. M1 is useful not only for producing large amounts of one target nucleic acid sequence, but also for amplifying simultaneously more than one different target nucleic acid sequence located on the same or different nucleic acid molecules. ACC62635 to ACC62753 and ABR54841 to ABR54998 represent sequence used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Amplifying nucleic acid by contacting engineered nucleic acid strand having predetermined sequence at one end and sequence complementary to predetermined sequence at other end, with primer having predetermined
                                                                                                                             amplification; antibody libr

A; Description: A new subgroup of k type light chains (VkV) identified in A; Reference number: JE0243
A; Accession: JE0244
A; Molecule type: protein
A; Residues: 1-215 < ALI>
C; Superfamily: immunoglobulin V region; immunoglobulin homology
F; 16-90/Domain: immunoglobulin homology < IMM>

R; Alim, M.A.; Yamaki, S.; Hossain, M.S.; Takeda, K.; Kojima, M.; Takashi submitted to JIPID, November 1998
A; Description: Structure relationship of kappatype light chains with AL A; Reference number: JE0241
A; Reference number: JE0241
A; Molecule type: protein
A; Residues: 1-215 < ALI>
C; Superfamily: immunoglobulin V region; immunoglobulin homology
F;16-91/Domain: immunoglobulin homology < IMM>
